PS PUBLIC SEVA

PROJECT PRESENTATION

From civic concern to accountable action.

A digital platform for reporting infrastructure hazards, sharing precise evidence, and helping each issue find its way to the responsible authority.

A citizen-to-resolution workflow for better public services

PROJECT OVERVIEW · PRESENTATION-READY BRIEF

01 · THE CHALLENGE

When something breaks in a city, being heard should not be the hard part.

01

Reports are scattered

People may not know which office, channel, or department should receive an issue.

02

Details get lost

A short message without a clear location, category, or photo can be difficult to act on.

03

Follow-up is unclear

Without a ticket and visible status, residents can struggle to know whether a report moved forward.

04

Priorities compete

Teams need a consistent way to identify urgency and send work to the right operational queue.

The opportunity: make the reporting journey structured, traceable, and easier for both residents and authorities to understand.

02 · THE SOLUTION

One clear path from observation to a trackable response.

01

Capture the issue

Citizens describe a hazard, select its category and priority, and add location details and optional image evidence.

02

Connect it to action

The platform creates a ticket, maps the category to a responsible department, and attempts configured delivery.

03

Keep progress visible

Residents can see their reports and status. Administrators can review, assign, update, and document outcomes.

In one sentence: Public Seva turns a civic concern into a structured case with a location, an owner, and a status that can be followed.

03 · WHO IT SERVES

Designed around two sides of public service.

CITIZEN

A straightforward way to raise a concern

Create an account, submit a report, include a photo and GPS coordinates, receive a ticket, and follow the report in a personal dashboard.

Report hazards | Capture location | Track status

ADMINISTRATOR

A shared view of incoming work

Review all reports, monitor totals and priority, update the report lifecycle, assign a department, and record resolution notes.

Review reports | Update workflow | Record actions

The application enforces separate public and administrator roles on the server, not only in the interface. A configured authority account is required for admin operations.

04 · HOW A REPORT MOVES

A simple journey with clear hand-offs.

STEP 01

Sign in

A citizen registers or logs in; optional Google sign-in can be enabled with credentials.

→

STEP 02

Describe

Enter the issue, category, priority, location description, coordinates, and optional photo.

→

STEP 03

Route

A ticket is created and the report is mapped to a department based on its category.

→

STEP 04

Follow through

An administrator updates status and notes; the resident checks progress in the dashboard.

Received **Reviewing** **Assigned** **In progress** **Resolved** **Closed**

Department delivery is configurable: webhook or SMTP when configured; otherwise the report is stored with a local-queue delivery status.

Built to make reports useful, not just submitted.

Structured reporting

Five issue categories, four priority levels, descriptive location, validated coordinates, and optional photo evidence.

GPS support

Browser location capture can populate latitude and longitude; users can also enter coordinates manually.

Ticketing & routing

Reports receive a Public Seva ticket number and a category-based department route.

Dashboards

Citizen report history and administrator-wide report views include summary counts and status.

Evidence handling

Image uploads are limited to 10 MB and stored by the server with a normalized, unique filename.

Activity records

Authentication, AI classification/insights, report routing, and status updates can be recorded as audit activity.

06 · DEPARTMENT PATHWAYS

Category becomes a practical starting point for routing.

Roads & transport

Transport Department · configured response window: 8 hours

Utilities

Utilities Department · configured response window: 8 hours

Water & sanitation

Water & Sanitation Department · configured response window: 4 hours

Public infrastructure

Public Infrastructure Department · configured response window: 24 hours

Safety & emergency

Safety & Emergency Department · configured response window: 2 hours

Delivery options

Webhook first, SMTP if configured, then a persisted local queue status. The route and integration endpoints need deployment-specific configuration.

> These response windows are routing metadata in the application. They are not a guarantee that an external department has accepted or resolved a case.

07 · HOW IT IS BUILT

A web client, an API, and a data layer that can evolve.

React + Vite
Responsive interface
Pages, forms, dashboards

→

Node.js + Express
Authentication, role checks
Reports, routing, AI endpoints

→

Local JSON store
Default development persistence
Supabase schema also provided

Frontend

React, React Router, Vite, Lucide icons, and a Three.js-powered city scene.

Backend

Express API with JWT sessions, password hashing, file uploads, validation, and department routing.

Integrations

Optional Gemini classification, Google identity, SMTP/webhook delivery, and a Supabase schema for a hosted data direction.

Important distinction: the current API uses a local JSON file by default. A Supabase schema is included, but the application code shown does not yet switch its data operations to Supabase.

AI can help organize a report; people remain accountable for action.

Classification assistance

When a Gemini API key is configured, the backend requests a category and priority suggestion from the report title and description.
Fallback: if Gemini is unavailable, keyword-based local rules return a clearly identified deterministic result.

Impact insight panel

The panel presents a risk score, signals, a response window, and recommended actions based on the report fields.
Current behavior: the score and recommendations are rule-based heuristics; do not describe them as a validated predictive model.

Responsible framing: AI output is decision support for triage—not proof of a hazard, a final priority decision, or a promise of response time. Human review and real-world validation remain essential.

Protect the report journey at each important boundary.

Account protection

Passwords are hashed server-side with bcrypt; signed sessions expire after 12 hours.

Role-based access

Public and admin API routes apply server-side authentication and role checks.

Safer handling

Helmet headers, API rate limiting, upload size/type checks, coordinate validation, and filename normalization are present.

Traceability

Key activity such as sign-in, classification, routing, and status updates can be written to audit records.

Hosted data option

A Supabase SQL schema defines users, hazards, audit logs, and row-level security policies.

Before production

Set strong secrets and real integration credentials; review RLS policies, admin provisioning, backups, retention, and operational monitoring.

A strong foundation for a more connected service workflow.

What it enables today

- Consistent, location-aware hazard reports
- Citizen and administrator views of report progress
- Category-based department assignment metadata
- Optional external delivery integrations

What should come next

- Connect the app to a production database and test migrations
- Configure real departments, authenticated delivery, and acknowledgements
- Add map-based report browsing and richer filtering/search
- Strengthen audit history, admin provisioning, retention, monitoring, and accessibility testing

Be transparent in a demo: the “Public reports” page currently explains the reporting process; it does not display a live public report feed. Department delivery can remain queued until a webhook or SMTP integration is configured.

Better public services begin when a report has somewhere to go—and someone can follow what happens next.

Public Seva gives citizens a structured way to raise infrastructure concerns and gives administrators a shared workflow to review, route, and track them.

Make the issue clear

Good details, location, and evidence help teams understand the need.

Make ownership visible

A department route and ticket provide a starting point for accountability.

Make progress followable

Status updates help close the loop between residents and administrators.

APPENDIX · SUGGESTED LIVE DEMO

A five-minute walkthrough that tells the whole story.

01 · 45 SEC

Open the landing page

Introduce the challenge and show the report and workflow entry points.

→

02 · 90 SEC

Create a sample report

Show category, priority, location/GPS, optional image, and classification assistance.

→

03 · 60 SEC

Show routing & ticket

Explain the generated ticket, department mapping, and configured/queued delivery status.

→

04 · 90 SEC

Switch to admin view

Show report metrics, update the status, add resolution notes, then return to citizen tracking.

Suggested opening: “Public Seva is built around a simple idea: reporting a city issue should be easy for residents, and following its progress should be possible for everyone responsible for resolving it.”
